

Threaded Rod Split Support

Threaded Rod Connector

Clamp-Bolt Side Plate

Height of the top of the track: _____ above the finished floor.
(located on quote form)

- step 1** The threaded rod mounting system, with beam clamps and side mount plates, is designed to attach to a sloped beam that runs above your proposed track. The threaded rod allows you to drop the curtain and track down below your beam and also to level slope.
- step 2** The beam clamps are to be clamped onto your beam in the ceiling.
- step 3** The side mount plate is attached to the face of the beam clamp, via the provided bolt. The bolt should fit into the threaded hole on the face of the clamp and secure the plate to the clamp.
- step 4** The threaded rod is to be attached to the plate via the threaded hole on the bottom of the plate. The plate should be able to adjust so that it is angling the rod straight down, not an angle. Once the angle is adjusted, the bolt should be tightened to re-secure the plate.
- step 5** The threaded rods are designed to drop down and connect to your track at the other end (the end not occupied by the beam clamp and plate). Threaded rods come in standard lengths and may need to be cut in the field.
